Electric Power Systems Research 30 (1994) 288–289

ELECTRIC POWER SYSTEMS RESEARCH

Subject Index of Volume 30

Alarm processing
object oriented expert systems for real-type power system alarm processing, 69, 77
Artificial neural networks
hydroelectric generation scheduling using self-organizing feature maps, 1
artificial neural network pattern classification of transient stability and loss of excitation for synchronous generators, 9
a neuro-fuzzy hybrid power system stabilizer, 17
an artificial neural network based identification and control approach for the field-oriented induction motor, 35
practical considerations in the application of artificial neural networks to the identification of harmonic loads, 103
an architecture for the intelligent detection and alleviation of overloaded transmission lines, 241
Automation technology
process automation configuration tool for Little Gypsy Unit No. 1 automated start-up/shut-down, 183

Bus transfer
operational problems with large induction motors connected to a small power system, 57

Contingency analysis
on-line steady-state security assessment of power systems, 123
a compact algorithm for the steady-state security assessment of power systems, 135
Control strategies
an artificial neural network based identification and control approach for the field-oriented induction motor, 35
fuzzy optimal reactive power control, 47
hierarchical optimization for power system control, 235
an architecture for the intelligent detection and alleviation of overloaded transmission lines, 241
Controllers
frequency domain analysis of a superconducting generator, 107
global optimization method for controlling a plant, 257

Distribution system reconfiguration
distribution system reconfiguration to reduce resistive losses, 25
Dynamic stability
operational problems with large induction motors connected to a small power system, 57
modeling of a large electric power system for optimal control of dynamic stability, 191

Economic power interchange
application of optimal power flow to interchange brokerage transactions, 83
Electromagnetic fields
influence of low-frequency electromagnetic fields on living organisms, 229
Electromagnetic transients program
the EMTP as an effective tool to evaluate active power filters for harmonic compensation, 269
Expert systems
object oriented expert systems for real-time power system alarm processing, 69, 77
unit commitment by genetic algorithm and expert system, 115
an architecture for the intelligent detection and alleviation of overloaded transmission lines, 241

Faults
artificial neural network pattern classification of transient stability and loss of excitation for synchronous generators, 9
object oriented expert systems for real-time power system alarm processing, 69, 77
Fiber optic sensing
fiber optic sensing applications in the electric power industry, 215
Filters
an optimization based technique for power system harmonic filter design, 63
optimum distribution system harmonic filter design using a genetic algorithm, 263
the Electromagnetic Transient Program (EMTP) as an effective tool to evaluate active power filters for harmonic compensation, 269
Frequency domain analysis
frequency domain analysis of a superconducting generator, 107
Fuel scheduling
comparison of linear, nonlinear, and network flow programming techniques in fuel scheduling, 169
Fuzzy logic applications
a neuro-fuzzy hybrid power system stabilizer, 17
Fuzzy modeling
fuzzy optimal reactive power control, 47

Genetic algorithms
unit commitment by genetic algorithm and expert system, 115
optimal clustering of power networks using genetic algorithms, 209
optimum distribution system harmonic filter design using a genetic algorithm, 263

Harmonics
an optimization based technique for power system harmonic filter design, 63
calculation and harmonic analysis of transient inrush currents in three-phase transformers, 93
practical considerations in the application of artificial neural networks to the identification of harmonic loads, 103
heat pump harmonic evaluation, 175
optimum distribution system harmonic filter design using a genetic algorithm, 263

Elsevier Science S.A.

the Electromagnetic Transients Program (EMTP) as an effective tool to evaluate active power filters for harmonic compensation, 269
Health studies
influence of low-frequency electromagnetic fields on living organisms, 229
Heat pumps
heat pump harmonic evaluation, 175
Holographic associative memory
an architecture for the intelligent detection and alleviation of overloaded transmission lines, 241
Hydroelectric generation scheduling
hydroelectric generation scheduling using self-organizing feature maps, 1

Induction motors
an artificial neural network based identification and control approach for the field-oriented induction motor, 35
operational problems with large induction motors connected to a small power system, 57
modeling of saturation in induction machines using EMTP, PSpice and a dedicated computer program, 279

Load data classification
hydroelectric generation scheduling using self-organizing feature maps, 1
Load flow algorithms
a parallel load flow algorithm, 203

Modeling techniques
modeling of a large electric power system for optimal control of dynamic stability, 191

Network decomposition
optimal clustering of power networks using genetic algorithms, 209

Optimal control
modeling of a large electric power system for optimal control of dynamic stability, 191
Optimal power flow
application of optimal power flow to interchange brokerage transactions, 83
Optimization techniques
fuzzy optimal reactive power control, 47
an optimization based technique for power system harmonic filter design, 63
application of optimal power flow to interchange brokerage transactions, 83
optimal clustering of power networks using genetic algorithms, 209
hierarchical optimization for power system control, 235
global optimization method for controlling a plant, 257
Overloaded transmission lines
an architecture for the intelligent detection and alleviation of overloaded transmission lines, 241

Parallel processing
a parallel load flow algorithm, 203
optimal clustering of power networks using genetic algorithms, 209
Performance indexes
global optimization method for controlling a plant, 257
Power losses
distribution system reconfiguration to reduce resistive losses, 25
Power system stabilizers
a neuro-fuzzy hybrid power system stabilizer, 17
Programming techniques
fuzzy optimal reactive power control, 47
comparison of linear, nonlinear, and network flow programming techniques in fuel scheduling, 169

Saturation modeling
modeling of saturation in induction machines using EMTP, PSpice and a dedicated computer program, 279
Security assessment
a compact algorithm for the steady-state security assessment of power systems, 135
power system voltage stability and security assessment, 197
Shield wires
modeling and simulation of transmission system shield wires under unbalanced conditions, 223
Switching
distribution system reconfiguration to reduce resistive losses, 25
electromagnetic transients in compensated transmission lines, 149
Synchronous generators
artificial neural network pattern classification of transient stability and loss of excitation for synchronous generators, 9

Transformers
calculation and harmonic analysis of transient inrush currents in three-phase transformers, 93
Transient currents
calculation and harmonic analysis of transient inrush currents in three-phase transformers, 93
Transient stability
artificial neural network pattern classification of transient stability and loss of excitation for synchronous generators, 9
hierarchical optimization for power system control, 235
Transmission lines
electromagnetic transients in compensated transmission lines, 149
modeling and simulation of transmission system shield wires under unbalanced conditions, 223
an architecture for the intelligent detection and alleviation of overloaded transmission lines, 241

Unit commitment
unit commitment by genetic algorithm and expert system, 115

Voltage stability
power system voltage stability and security assessment, 197
